

# ALARMS AND ALERTS

## UPSOLUT

THERE ARE THREE OCCUPANCY **ALARMS AND ALERTS** THAT COME STANDARD WITH THE INDECT UPSOLUT SYSTEM. ➔

The three occupancy alarms and alerts are:

- Overstay
- Vehicle arrived
- Vehicle left

Overstay is the most widely used alert for a parking space. This will allow you to easily detect parkers misusing the parking area. The system will create an alarm at the management computer if a vehicle stays beyond a pre-set time limit, such as 4 hours. The time limit can be set at different levels for different areas or even spaces, to accommodate longer periods for disabled spaces or short periods for visitor spaces. For example, we will set the timers in the transient parking areas to detect misuse by staff or commuters.

As can be seen above, the icon for the space will change color in the user interface from red to pink when a vehicle overstays. This will immediately alert the staff at the control center for the parking garage. The time the vehicle arrived is also displayed in the user interface on the bottom left of the map (10:16:37).

The LED space indicator can also be set to flash and/or to change to a different color to assist roaming security or parking staff that the vehicle has overstayed.

The system can create an infringement report that includes footage of the car arriving and leaving as well as a photo of the vehicle and the license plate.

The system can also produce an alert when a space is occupied or becomes vacant. This is a useful operational tool for greeting VIP's, or if you need to close a space for operational reasons.

All alerts are recorded in the user interface and in the system log.
