BLACK & WHITE LISTS
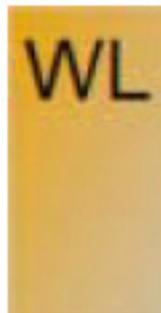

UPSOLUT

BLACKLISTS AND WHITELISTS ARE USED TO CREATE GREATER CONTROL OVER YOUR PARKING OPERATION.

Occupied space with Blacklist violation — alert *space marked on floor plan*

Occupied space with Whitelist violation — alert *space marked on floor plan*

Lists are set up by the parking operation and uploaded into the system. A vehicle that is on a blacklist is not allowed to park in the designated space. A space with a whitelist only allows certain vehicles to have access to that space.

Typically, a whitelist is used to protect areas or spaces that are dedicated to certain users. For example, a whitelist could be established in a reserved parking space or a staff parking area. If a vehicle that is not on the list parks in the space or area an alarm is created.

A blacklist is used to prevent people parking in an area. Typically staff vehicles are added to the list to prevent them parking in the hourly parking zones. The blacklist could also be a list of vehicles of interest from the local law enforcement.

A space can have both an active whitelist and blacklist at the same time. The lists can be applied to any space or set of spaces in the garage.

A list can have a start and end time and date. For example, you may have a whitelist for an office parking zone Monday to Friday 6am to 6pm, but then allow the spaces to become available to visitor parking at nights and weekends.

The violation of any list will create an alarm in the system. This will appear on the user interface by the space icon changing color (see left).

An audible alert can be created if the operating PC is connected to speakers. The alert can be emailed or sent via SMS. It can cause the space indicator light to flash or change color. Additionally, it could also set off an audio alert if a speaker is attached to the sensor. These tools allow you to proactively manage your parking spaces.
