EXTENDED LEDS

UPSOLUT

LEDS

A UNIQUE FEATURE FOR THE INDECT UPSOLUT CAMERA SYSTEM IS THE ABILITY TO PROVIDE ONE LED INDICATOR PER PARKING STALL. ↪

This provides the effect and granular information to the driver of a regular parking guidance system.

Instead of the sensor having the LED indicator inside of the sensor casing, the LEDs are extended to the end of each parking space on a dropper.

The LEDs use RGB color technology. Colors can be programmed to suit your operational requirement.

This type of installation is typically used where there are many user groups. The individual lights allow each user group space to be called out with a unique color.
