

FIN FIND A CAR UPSOLUT AR

THE INDECT UPSOLUT SYSTEM
USES THE CAMERA TO CAPTURE
AN IMAGE OF THE CAR AND THE
LICENSE PLATE. 

The system runs license plate recognition software to read the license plate using Optical Character Recognition (OCR).

The license plate is a unique identifier for the vehicle. The system allows you to search for cars using the license plate.

The operator simply opens the software, enters the license plate and the system brings up a map showing exactly where the vehicle is parked.

The operator can also click on that space and get a high-resolution image of the vehicle. They can add notes to the image for future reference. They can also see the exact time of entry of the vehicle.
