# RESERVATIONS

UPSOLUT

INDECT ALLOWS FOR SPACES TO BE RESERVED AT THE CLICK OF A MOUSE.

Spaces can be reserved on the following basis:

- One off
- Regularly – for example every day at 6pm till midnight
- Date and time
- Permanently

When a parking space is reserved, the LED space indicator is set to always occupied (normally red) or to a special color just for reservations.

The LED signs relating to the spaces treat them as if they were occupied. This is so that transient clients are not directed to these spaces.

A reserved parking space is easily identified in the user interface as it is marked with a round circle. The status of the space is still shown under the circle (green for vacant, red for occupied, blue for disabled etc).

The staff can insert text against the reservation. The text is listed beside the reservation so other staff can easily see why the reservation is in the system.

The text could be exported to our optional matrix panel signs installed on these VIP spaces. These signs are full color panels that can display words and text (see "matrix Signs"). The signs could display the name or license plate for the reserved customers.

The Upsolut sensor can monitor the parking space and use a white list of authorized plates for vehicles that are allowed to use the reserved space. It can create an alert if an unauthorized vehicle parks in the space.

Audio alerts can be used to warn people they are parking in a reserved space using the unique Upsolut audio output feature (optional).

The system can be interfaced to an online reservations system. The system can have reservations placed directly into the database. This will allow reservations to send the time, date and also the reservation text as above.
